Memory State :

Goes to memory state in conditions like $(0, x, x)$
& $(1, 0, 0)$ i.e.

$$C = 0, S = x, R = x$$

&

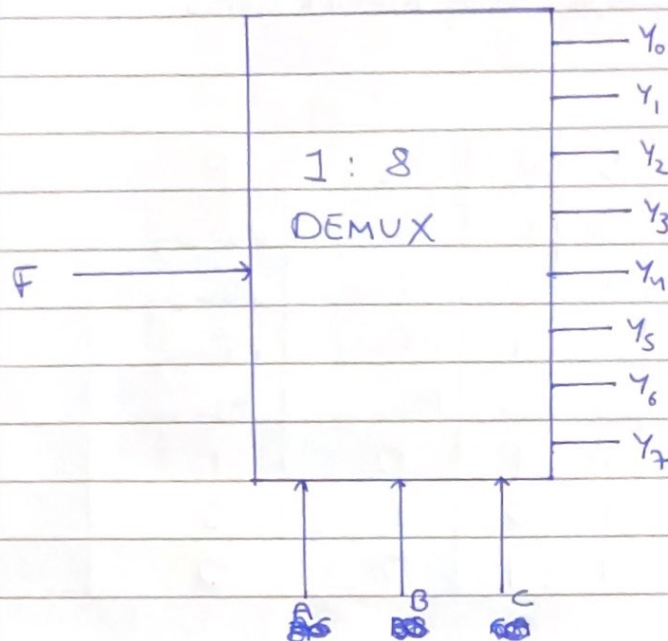

$$C = 1, S = 0, R = 0$$

Undesirable State :

When

$$C = S = R = 1$$

P5. A. We can use 2:1 MUX where selection line is P

C.

P6. a) Q becomes equal to D on the negative edge of $CLK \rightarrow Q=1$

b) $\overline{PRESET-N}$ asynchronously sets Q to 1.

c) Since $\overline{CLEAR-N}$ is asynchronous, pulsing $\overline{CLEAR-N}$ clears Q immediately to 0.

d) $\overline{PRESET-N}$ will set Q asynchronously to 1.

e) $Q = 1$.

Although this is an undesirable state, Q can be determined due to previous knowledge of NAND gates used in construction of this DFF. (Not true for all DFF's as some use NOR Gates)

f) $\overline{PRESET-N}$ asynchronously sets Q to 1.

g) $\overline{CLEAR-N}$ asynchronously sets Q to 0.

h) Q becomes equal to D at negative edge of CLK as normal: $Q=1$
